# Do Diseases with More Associated Genes Receive More Research Attention?

Mahnoor Haider
Northeastern University

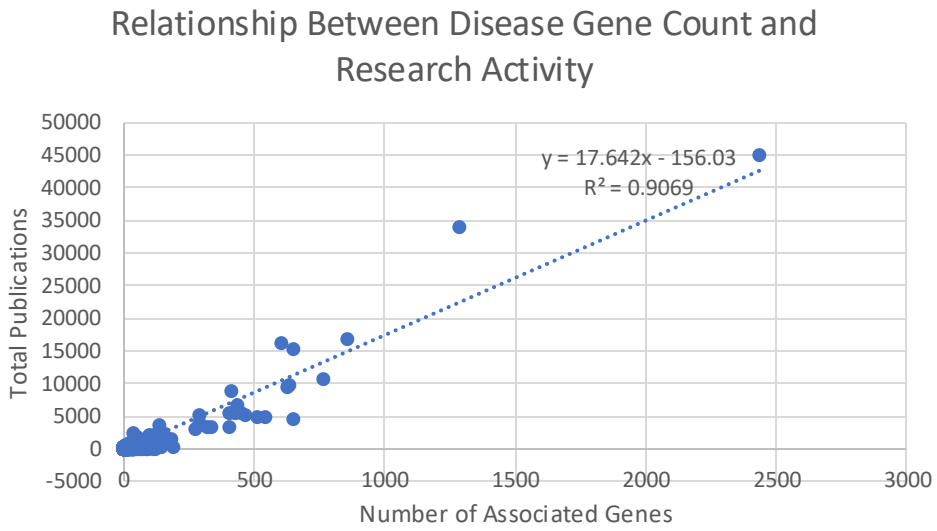

## ABSTRACT

Medical research funding and publications can vary drastically from disease to disease. It begs the question: does the number of associated genes in a given disease affect how much research is published regarding it?

## METHODOLOGY

```
select
    disease_name,
    count(distinct gene_id) as num_genes,
    sum(num_pubs) as total_pubs
from disgenet
where disease_type = 'disease'
group by disease_name
limit 500;
```

## RESULTS

## DISCUSSION/CONCLUSIONS

A strong, positive relationship was observed between the number of genes associated with a disease and the total number of publications investigating that disease ($R^2$ = 0.9069). This suggests that diseases with greater genetic complexity tend to receive more research attention. One explanation for this is that as additional genes get linked to a disease, more researchers may become interested in studying the different aspects of said disease, thus increasing the traction it receives and the number of publications.
